■ MicroWorld to exhibit its Security Solutions at Interop 2008

MicroWorld Technologies announced their participation in Interop 2008 with its partner Unitera. Interop 2008 is focused on offering a comprehensive IT view to enable innovation, business agility, and simultaneously getting the best return on investment for organizations. At Interop 2008, MicroWorld will be showcasing its latest eScan range of Digital Security Solutions to resellers and customers through its partner Unitera.

The eScan range of Digital Security Solutions are powered with the fastest and earliest updates for Threat Protection, and works on the unique MWL (MicroWorld Winsock Layer) that provides proactive and complete protection against all kinds of digital threats.

Rohini Sonawane, the COO of MicroWorld Technologies, said that, "The eagerness of IT implementers for innovations and a keen interest in new technologies has always been the trait of business community. These innovations and technologies are coupled with threats that can harm businesses adversely."

④ MicroWorld Announces MailScan 5.6 for Mail Servers

MicroWorld announced the release of MailScan 5.6 version, the comprehensive content security software for Mail Servers. MailScan 5.6 is power packed with a host of proactive technologies and advanced algorithms. It is compatible with Windows Vista, Windows 64 bit platforms and now supports Lotus Domino 8 Mail Servers too.

MailScan uses powerful content filtering techniques like Greylisting combined with the unique NILP technology. Greylisting is a method of temporarily blocking mails from unknown senders and accepts the mail only on repeated attempts. NILP based on Artificial Intelligence analyzes mails to classify them as Spam or Ham based on the Behavioral Pattern of the user. MailScan also has a built-in AntiVirus scan engine powered by the revolutionary MWL technology and an advanced heuristic scanner that scans both inbound and outbound emails, for effectively blocking Malware at the MailServer itself before they can reach the endpoints.
