## MicroWorld AntiVirus Toolkit Utility (MWAV)

By **Manish Katara**

Anti-virus products traditionally do scanning of entire hard-drives to check files for viruses. But the ever increasing size of hard-disks and the millions of files that these hard-disks can store makes it practically impossible for anti-virus products to scan all the files within practical time limits. Since Microsoft's registry is not fully documented, anti-virus software often fail to catch viruses, which appear to resurface even after successful disinfections.

This is exactly what the MWAV toolkit attempts to solve. It searches deep into the registry, even looking for entries, which are normally not documented, and within minutes detects and removes viruses. The utility can also remove invalid and dead links inside the registry, which often cause unnecessary warnings to fill up the event logs.

Some of the new features can detect porno dialers, adware, spyware and riskware. Additionally, MWAV can now update itself automatically so that it can scan for all the new viruses. The toolkit utility can also activate itself for removing/disinfecting worms and viruses apart from weeding out worms that attach themselves to browsers like Internet Explorer. It can also remove "invalid" and "dead links" inside the registry, which often causes unnecessary warnings to fill up the Event Logs. One can add this utility to the startup list of programs on the computer so that it scans the computer every time you start using it.

New upgraded MWAV can be downloaded from the following links;

<ftp://ftp.microworldsystems.com/download/tools/mwav.exe>

<http://www.mwti.net/download/tools/mwav.exe>

For more information please visit <http://www.mwti.net/antivirus/mwav.asp> or write to [sales@mwti.net](mailto:sales@mwti.net)

Note- MicroWorld AntiVirus Toolkit Utility is free to scan computer for detecting virus, background illegal sniffers or tools like spywares, adwares, keyloggers etc. running in the memory of your computer.
