eScan Achieves Approval From VB100% Once Again

Published 2nd June 2006

The developers of the world's most advanced Security Solutions, MicroWorld Technologies, today announced that their AntiVirus and Content Security solution eScan has won the VB100% award once again. With eScan fast becoming the most preferred Security Solution for enterprises and home users alike, this continued approval is another shot in arm for its winning streak...

Virus Bulletin Organization based in UK, is one of the most revered testing bodies in the AntiVirus industry. VB100% Award is given to those products that pass the stringent testing done at the Quality Assurance organization.

"VB100% process is a thorough analysis of quality and performance of AntiVirus Solutions," said Govind Rammurthy, CEO, MicroWorld Technologies. "When you consider the fact that even a 1% leeway or laxity from an application will render the entire defense system ineffective and can trigger fast paced malware proliferation in networks, this test becomes a vital parameter for any AntiVirus solution. It's highly gratifying to see that along with our consistent innovation and futuristic approach, we are also scoring the best in all yardsticks of accuracy and functionality."

eScan from MicroWorld, is a comprehensive AntiVirus and Content Security solution that implements protection against Viruses, Worms, Trojans, Rootkits, Keyloggers, Spyware, Adware, Hackers, Spammers, privacy related issues and objectionable content.

eScan differs from other security products of the present-day market on four basic counts. One, its powerful AntiVirus engine with the fastest detection rate. Two, unique and patent pending MWL technology that enables malware scanning at the Socket Level, while saving the need to write files to temporary folders. Three, highly advanced Heuristic method to catch new and hidden Viruses and other malware. Four, its earliest updation of mushrooming breeds of Spyware and Adware.

“The enterprise version of eScan is fundamentally designed to enforce an Integrated Security Policy for organizations with Software Deployment, Outbreak Prevention and Security Management conducted at a central point. Comprehensive monitoring of Data Traffic over TCP and UDP is made possible by ‘TCP Connections’ feature. Remote Web Administration option empowers the system administrator to manage the security of an organization, even at a distant access. This large scale architecture makes sure that not only we deliver the most powerful threat prevention, but also a comprehensive security management across the enterprise,” explained Govind Rammurthy.
