

# eScan

An enterprise-wide, anti-virus software that scans local and network drives and TCP/IP traffic for viruses and cleans them on a real-time basis with MicroWorld Winsock Layer (MWL) technology.

It works in the background, protecting the system from viruses and worms at all times. Unlike other packages, eScan not

only protects the system from e-mail bombs, but also provides a host of features that maximise the bandwidth. eScan is also designed to understand different file types, data streams and compression formats - it can look inside data streams and identify complex file architecture.
